EDUCATION

The University of Texas at Austin
Master of Science in Computer Science — **August 2025 – May 2027**
Bachelor of Science in Computer Science (Integrated) — **August 2022 – May 2027**
Certificates and Minors: Business, Spanish
Graduate GPA: 3.92

Relevant Coursework: System Performance Analysis, Natural Language Processing, Data Structures, Algorithms and Complexity, Ethical Hacking, Human Computer Interaction, Approximation Algorithms, Operating Systems, Generative AI, Nondeterministic Software Testing

SKILLS

Programming Languages: Python, Go, C++, C, Java, SQL, JavaScript, Swift, HTML/CSS
Tools: PyTorch, GitHub Actions, RLlib, MongoDB, AWS, Docker, Firebase, REST API, git/GitHub, Agile, GitHub Copilot, ReactJS, Microsoft Office
Languages: Native English, Working Spanish, Beginner German

EXPERIENCE

Software Developer Intern – IBM HashiCorp; Austin, Texas — **May 2026 – August 2026**
- Led a three-developer engineering effort to automate public-facing documentation generation for HCP Terraform and Terraform Enterprise, building reusable tooling and CI integrations to streamline documentation production and maintenance.
- Integrated an OpenAPI specification-driven code generation system developed by other engineers into an existing codebase, connecting generated components to application internals and dependent workflows while identifying generator defects through end-to-end validation.
- Developed agentic AI-assisted workflows spanning multiple teams to streamline software development and maintenance, reducing repetitive engineering work and improving cross-team collaboration.

Head Teaching Assistant – UT Austin Computer Science; Austin, Texas — **August 2023 – Present**
- Managed a team of 13+ TAs for a core CS course, ensuring smooth execution of grading, office hours, and drove curriculum improvements for 600+ students per semester and performed quality assurance testing for their work.
- Built and deployed a Docker-based automated software testing framework in Python, reducing grading time by 40% and ensuring generalizability across different system configurations.
- Analyzed student performance data to inform targeted instructional improvements, contributing to a 10% increase in passing rates in evaluated sections.

Software Intern – A.D. Immigration Law; Dallas, Texas — **May 2025 – July 2025**
- Built a full-stack client evaluation and tracking application using Python, SQL, and React, reducing client assessment time by 15% and standardizing cost-benefit analysis and decision-making workflows.

Machine Learning Research Intern – UTCS Labs; Austin, Texas — **September 2024 – January 2025**
- Developed and evaluated an adaptive, online-learning LLM routing algorithm that dynamically selected between GPT-4 and distilled models, reducing inference costs by up to 90% while retaining over 99% of baseline accuracy on a custom image question-answering dataset.
- Designed a COCO-based multimodal code-generation benchmark and developed image question-answering evaluation tasks to analyze model efficiency, accuracy, and cost-quality tradeoffs.

SELECTED PROJECTS

Choreography Design Tool | Python, ReactJS; https://github.com/GreyBaker/chor.io
- Developed a choreography planning and review platform adopted by 5+ performance groups, implementing synchronized music and movement timelines and refining user workflows through research-driven interface design.

Driving Safety App | Swift, Python, Firebase, Figma
- Built an iOS-based driver-assistance prototype using computer vision and custom hazard-detection logic to identify potential roadway risks and generate alerts.
- Integrated mobile ML inference with Firebase-backed updates and monitoring.

Data-Efficient Excavator | Python, PyTorch, Newton Physics Simulator
- Developed a video-based robot-learning approach for excavator tasks, incorporating data extraction from low-quality footage, model training, and a simulation environment for evaluating learned behavior.
- Investigated the feasibility of using imperfect real-world visual data as a training source for robotic learning, documenting the methodology and experimental findings in a technical paper.

Vector Databases Approaches | C++, Python, SQL
- Implemented, modified, and evaluated a LindormVector inspired vector DBMS approach to reproduce published research results, examining retrieval performance, indexing efficiency, and tradeoffs between accuracy and resource usage.

ADDITIONAL

- **Honors**: University Honors (Fall 2022 – Spring 2025); Eagle Scout (2022)
- **Interests/Hobbies:** Swing Dancing, Lion Dance (Vice President), STEM Outreach (Senior Presenter), Volleyball, Bouldering, Horseback Riding
- **Work Eligibility:** U.S. Citizen
